## The 3k + 1 Problem

#### 1.1 Theory

Let  $k \in \mathbb{N}$  be a natural number. We consider the sequence  $n(i,k), i \in \mathbb{N}$ , with n(1,k) = k and else n(i+1,k) = n(i,k)/2 if n(i,k) is even and n(i+1,k) = 3n(i,k)+1 if n(i,k) is odd.

It is not known whether for any natural number  $k \in \mathbb{N}$  there is an  $m \in \mathbb{N}$  with n(m,k) = 1.

ThreeKPlusOne provides the function ThreeKPlusOneSequence (1.2.1) to explore this for given n. If you really want to know something about this problem, see [Wir98] or http://www.ku.de/mgf/mathematik/lehrstuhlstatistik/team/dr-guenther-wirsching/for more details (and forget this package).

#### 1.2 Program

In this section we describe the main function of this package.

#### 1.2.1 ThreeKPlusOneSequence

(function)

This function computes for a natural number k the beginning of the sequence n(i,k) defined in section 1.1. The sequence stops at the first 1 or at  $n(\max_{k} k)$ , if  $\max_{k}$  is given.

```
gap> ThreeKPlusOneSequence(101);
"Sorry, not yet implemented. Wait for Version 84 of the package"
```
